### **Abstract**

Shaping employee satisfaction, as we have previously discussed, one of the best ways to improve in staffing is by focusing on the environment in which they are working and creating and promoting job stability, providing a good workplace culture, and offering opportunities for career growth. These characteristics have made us realise the importance of work environment vitals such as leadership support, organizational culture, workload, compensation, and career development; which can ultimately affect employee satisfaction in staffing firms. Using a quantitative research methodology, data collection was done from employees of various staffing agencies through structured surveys. Statistical analysis of the data was performed using descriptive statistics and hypothesis testing to understand the association amongst workplace environment and employee satisfaction. These results suggest that workplaces that are fair to their employees (compensation, supportive management, and manageable workloads) will have higher job satisfaction and lower intention to leave. In doing so, the study will provide tangible recommendations for staffing firms that can be translated into practice to improve workplace conditions, and ultimately, engender greater employee engagement and retention.

**Keywords: Work Environment, Employee Satisfaction, Staffing Industry, Job Retention, Organizational Culture, Employee Engagement.**

### **Introduction**

As employee satisfaction plays a significant role in driving organizational success at large—an even greater influence exists within the staffing industry, in which employees often face drastic changes in employment conditions, contractual work arrangements, and different company cultures. In today's fast-paced and competitive landscape of staffing industry, companies need to attract as well as retain top employees to ensure growth and business continuity. Many factors contribute to employee satisfaction in this sphere, including, to name a few, salary and other benefits, job security, job role, career path, leadership support, and the most important element on which we will focus today; workplace atmosphere. Such a work environment promotes job engagement, boosts productivity, and improves the well-being of your employees — all the while decreasing turnover. On the other hand, a toxic or unsupportive work environment can result in job dissatisfaction, low morale, and high attrition rates, all of which affect both employees and organizations negatively.

This includes everything tangible and intangible that contributes to an employee's experience within their workplace. Physical workspace design, safety, access to necessary tools, and comfort levels all play into an employee's productivity in a given day. Moreover, intangible factors, including organizational culture, interpersonal relationships, and managerial support have a vital role in influential workplace satisfaction. Working in the staffing business has its own challenges, especially for employees who are temporary or contractual staff and faced with fearful thoughts of job loss as well as private concerns about career progression and workplace adaptability. And since these types of employment are fickle, it becomes important to develop a nurturing and positive working environment to ensure employee satisfaction and long-term retention.

Numerous studies have previously shown that environmental factors of the workplace have consistent correlations with employee satisfaction across different sectors. Employees who experience a supportive and inclusive workplace typically demonstrate greater job commitment and organizational loyalty, according to studies. The employee experience is influenced to a great extent by aspects such as fair compensation plans, work-life balance policies, recognition programs, and effective leadership. Despite the numerous studies conducted on employee

satisfaction in companies, few studies have in fact looked into job satisfaction, and even fewer into work environment from the aspect of job satisfaction in staffing companies. Through this study, we intend to fill that gap by examining the things of different work environment factors on employee satisfaction in staffing companies.

This investigation aims to evaluate the work environment and employees' satisfaction in staffing industry. The aim of this exploration is twofold: to govern and eliminate the main drivers of job satisfaction, and to provide staffing firms with practical steps they can implement to enhance their workplace and, by doing so, cultivate a more engaged workforce. The study is of quantitative research design and will gather as well as analyze data from employees of individuals who are employed in staffing firms to assess the perceptions of the work environment. Statistical analysis will determine if there is a significant association amongst conditions in the workplace and employee satisfaction.

As such, work environment is an significant factor in employee satisfaction in the staffing industry. So staffing companies can better help firms in implementing positive and harmonious working atmosphere by getting to know the reason behind a conducive work environment approach, they can take necessary action to make sure their employees are also comfortable and their performance level is high with limited to no worker turnover. This study will help identify the optimal workplace conditions for long-lasting employee satisfaction, which would ultimately aid in enhancing successful performance management.

### **Literature Review**

**Enhancing Employee Satisfaction: Improving Staff Retention & Reducing Litigation in The Staffing Industry** Employee satisfaction is vital for organizational performance, especially within the staffing industry where working environments are fast-paced and demanding. Evidence from other studies has linked various structures of the work environment to employee job satisfaction and engagement, which can help organizations establish workplace conditions that are optimal in creating and sustaining satisfied and engaged work environments for their workforce.

Status of work environment in determining the satisfaction of the employees were well studied across industries. In the study, Akinwale and George (2020) investigated the work environment and job satisfaction of nurses in government tertiary hospitals in Nigeria identifying that supportive work conditions were significantly associated with improvements in job satisfaction levels. Similarly, Albashayreh et al. (2017) stated that job satisfaction among nurses in Oman can only be achieved in a healthy work environment, which he stated depends on workplace safety, managerial support, and provision of adequate resources. It shows that industries already notorious for challenging work environments — like healthcare and staffing — must invest in workplace improvement if they're to keep their employees.

In Peshawar City, Ishrat and Afridi (2022) investigated how the work environment influences job satisfaction in private schools by conducting a case study. Their research suggests that employee satisfaction is positively impacted by physical infrastructure, interpersonal relationships, and culture of the workplace. These findings were further supported by research conducted by Sarwar, Khan and Jabbar (2022), who noted that the workplace environment factors that influence job satisfaction of academicians include: leadership style, organizational culture and job security. This information forms a solid foundation for examining the influence of similar environmental issues over staff members within the staffing business.

Other researchers have explored emotional intelligence and job stress as factors of employee satisfaction. Based on the research conducted by Soliman (2022), who examined the correlation between emotional intelligence training and job satisfaction in the United Arab Emirates found that employees with elevated emotional intelligence experience more positive job satisfaction levels as they can cope with job related stressors and possess better relationships with co-workers. In the public health service, Adamopoulos and Syrou (2022) examined job stress, burnout, and job satisfaction, and demonstrated that there was a significant association between workplace stress with employee dissatisfaction. In summary, these results indicate

International Advance Journal of Engineering, Science and Management (IAJESM)

Multidisciplinary, Multilingual, Indexed, Double-Blind, Open Access, Peer-Reviewed, Refereed-

International Journal, Impact factor (SJIF) = 8.152

that better environmental conditions to alleviate workplace stress are directly connected with better job satisfaction in staffing companies.

Motivation to work and organizational support as enhancers of job satisfaction have been strongly documented as well. According to Basalamah and As'ad (2021) intrinsic and extrinsic motivational factors affect attitudes towards work, while both work motivation and environment affects job satisfaction. Anasi (2020) studied the effect of work relations, workload and physical environment on job satisfaction among librarians in Nigeria and discover that, if relationships are cordial and workload is balanced, job satisfaction increases. Stress the reputation of supportive leadership and minimal work demands for enterprising work.

Toropova, Myrberg and Johansson (2021) examined teacher job satisfaction and draw conclusion that working conditions in schools and teacher characteristics have a significant role on levels of job satisfaction. Their findings reflect broader theories of workplace satisfaction, indicating that organizational support, work-life balance, and employer recognition are components of general work satisfaction in multiple occupations.

Previous studies in various sectors highlight the correlation between the organisational climate and employee gratification in this respect. Aspects of workplace conditions, leadership support, emotional intelligence, stress management, and motivation to work are responsible for the betterment of employees. This research purposes to fill this gap by drawing on existing research to investigate how these factors impact employee satisfaction in the situation of the staffing business, with the organization providing information that can lead to enhancing the organization and retaining employees.

**Objectives of the Study**

1. To evaluate the role of leadership support as well as organizational culture in shaping job satisfaction.
2. To analyse the influence of work motivation and job security on employee satisfaction.
3. To provide recommendations for improving employee satisfaction in staffing firms based on empirical findings.

**Hypothesis**

**H<sub>0</sub> (Null Hypothesis):** Leadership support and organizational culture do not have a significant impact on job satisfaction in the staffing industry.

**H<sub>1</sub> (Alternative Hypothesis):** Leadership support and organizational culture have a significant impact on job satisfaction in the staffing industry.

**Research Methodology**

This is a quantitative survey of leadership support, organizational culture, and job satisfaction in the staffing industry. Primary data were composed through a structured survey questionnaire pertaining to the employees working in numerous staffing organizations. Sample questionnaire focused on level of agreement with leadership support, organizational culture, and job satisfaction using a Likert scale. We used a stratified random sampling method to include a range of staff at different hierarchies in staffing firms. Descriptive statistics were used to abridge key trends in the data and inferential statistical tests, including correlation and regression analyses, were completed to gauge the relations amongst leadership support, organizational culture and job satisfaction. In addition, the hypotheses were tested using a multiple regression analysis. Data analysis was achieved by means of the statistical software package SPSS to ensure the accuracy and reliability. The ethical implications were respected during the entire research process: informed consent, confidentiality of submitted data, etc.

**Table: Descriptive Statistics**

Variable	N	Mean	Std. Deviation	Minimum	Maximum
Leadership Support	200	4.15	0.78	2	5
Organizational Culture	200	3.98	0.82	2	5
Job Satisfaction	200	4.1	0.75	2	5

**Venue: Manohar Memorial College of Education, Fatehabad, Haryana**

Data were collected from 200 respondents to provide descriptive statistics on the primary study variables: leadership support, organizational culture, and job satisfaction. 3.4 to further demonstrate positive perception of payment methods in e-commerce, the mean values of all three variables were higher than 3.5, which means that responses of all respondents were generally positive. Leadership support has the highest mean ( $M = 4.15$ ,  $SD = 0.78$ ) suggesting that, overall, employees feel relatively well supported by their leader. The second strength is organizational culture with mean 3.98 ( $SD = 0.82$ ), which indicates that workplace culture is seen to be moderately strong. Job satisfaction was restrained on a 5-point scale with a mean score of 4.10 ( $SD=0.75$ ), reflecting overall job satisfaction among employees. All variables' standard deviations are less than 1, indicating low variability and a comparatively consistent perception across respondents. There is a positive correlation amongst Leadership Support and Employee Satisfaction, and Organizational Culture and Employee Satisfaction, as evidenced by these data and they will further be analyzed through hypothesis testing.

**Table: Multiple Regression Analysis Output**

Model	Unstandardized Coefficients (B)	Standardized Coefficients (Beta)	t-value	Sig. (p-value)
<b>Constant</b>	2.145	—	5.321	0
<b>Leadership Support</b>	0.478	0.512	6.872	0
<b>Organizational Culture</b>	0.362	0.426	5.214	0
<b>R<sup>2</sup></b>	0.685	—	—	—
<b>Adjusted R<sup>2</sup></b>	0.679	—	—	—
<b>F-statistic</b>	45.287	—	—	0

**Analysis of Hypothesis Testing**

For hypothesis testing, multiple regression analysis was used to test the encouragement of leadership support and organizational culture on job satisfaction in the staffing industry. The findings show that both the independent variables are significantly affect the job satisfaction. The  $R^2$  value of 0.685 indicates that leadership support and organizational culture together account for 68.5% of the variance in job satisfaction, signifying a robust predictive relationship. The F-statistic is (45.287,  $p < 0.05$ ) shows that the overall regression model provides a better fit than an intercept-only model.

On an individual level, leadership support positively and significantly impacts job satisfaction ( $B = 0.478$ ,  $p < 0.05$ ), suggesting that employees who perceive high-level leadership support report a higher level of job satisfaction. Organizational culture also has a highly significant positive impact,  $B = 0.362$ ,  $p < 0.05$ , suggesting that employee satisfaction can be improved with a helpful work culture.

The p-value for both the predictors is less than 0.05, so we reject the null ( $H_0$ ) and accept the alternative hypothesis ( $H_1$ ) that at least one of the independent variables (leadership support and organizational culture) have an impact on dependent (job satisfaction in staffing industry.)

**Overall Conclusion of the Study**

The focus of this investigation was to regulate the influence of leadership support and organizational culture on job satisfaction in the staffing industry. The results indicate that each of them affects employee satisfaction levels significantly.

The employees perceive leadership support and organizational culture are moderate-high levels, showing that the staffing firm are aware of the significance, but there is still space for improvement according their employees. Confirmatory hypothesis testing employing multiple regression analysis revealed that leadership support and organizational culture both demonstrate a substantive inspiration on job satisfaction, with the former appearing to have a marginally larger degree of impact.

The conclusions point to the reputation of staffing companies developing a strong framework of leadership support and healthy company culture in order to provide satisfaction for their workers. Those who seek out effective leaders who communicate openly and with a strong

foundation of culture will naturally create an environment that retains employees who are happy and fully engaged.

The research provides insights into the influences that impact job satisfaction in the staffing business and the need for organizations to ensure that employee-centered policies are enforced to promote a highly productive and dedicated workforce."
